### \* Final Report \*

Mrs. Altindere was seen in follow-up of her general medical evaluation.

She was evaluated by the Department of to the diagnosed with Ehlers-Danlos syndrome, hypermobility type. She was also evaluated by the Department of Physical Medicine Rehabilitation and therapy was recommended for her at home with a prescription provided to her.

She was also evaluated by the Department of Cardiology diagnosed with autonomic dysfunction with neurocardiogenic syncope. She is unable to achieve her goals, a trial of midodrine can be performed. If after 6 months, she is unable to do 40 minutes of interval training 5 to 6 times a week, a PO2 treadmill to look for an underlying etiology should also be performed. A tilt-table study was performed to confirm the diagnosis.

She underwent an arthrotomy with assessment for scaphoid <sup>K</sup>capitate effusion versus proximal row carpectomy proceeding with proximal row carpectomy for right stage IIIB Kienbock's lunate avascular necrosis with early radius scaphoid degenerative arthritis. Prescription for occupational therapy was provided to her and she has completed an assessment here as well as follow up with her physician. She will continue occupational therapy in her local area.

Laboratory studies performed in conjunction with her overall evaluation revealed a borderline low calcium at 8.6 with an albumin of 4.1. Recommend repeat by her primary care provider. Total 25 hydroxy vitamin-D was 34. For red blood cells were noted in her urine. This should be repeated to ensure clearance and further workup as indicated through her local physicians.

No indication for the patient to be seen back in the Department of General Internal Medicine unless new needs or issues arise. 25/25 minutes spent in direct face-to-face counseling.
